

Front End Program Week 1 Research

Git is a software for tracking changes in any set of files. Web Developers use it as a collaboration tool for developing source code during software development. Git Workflow is a remote repository in a cloud database. Web Developers use the workflow to collaborate on source code. In Github developers create a "commit push" in, or a "pull request" out, to make changes to the source code. Developers can create a unique branch to collaborate with other developers and make changes before merging the code into the main branch or master branch.
